

Flow & Circulation

Adequate flow or water movement is required in a marine tank to maintain the health of fish, corals, and other livestock. Proper flow keeps waste and debris from settling in the aquarium and forces it into the filter where it can be removed.

Return Pumps

As the primary source of water movement in an aquarium, a return pump delivers water to and from the filtration system. Return pumps are available for internal use, external use, or both.

Recommended return pump sizes

 0 - 55 Gallons	500 GPH
 55 - 90 Gallons	750 GPH
 90 - 150 Gallons	1250 GPH
 150 - 250 Gallons	2000 GPH

Powerheads

The perfect add-on for improved circulation and water movement, powerheads are an easy way to add targeted flow to an aquarium. Powerheads can be used individually or as a group to create the flow needed for your corals and other livestock.

Maxi-Jet Upgrade Kits

Upgrade kits for Maxi-Jet powerheads produce a more widespread stream of movement, while increasing output up to 10 times! These improvements are perfect for reef tanks with corals that require indirect flow.
